4 An optical preamplifier with received signal strength

5 indicating function is disclosed that does not increase the

6 number of terminals. The preamplifier includes an amplifier

7 stage having cascaded amplifiers and a current mode output stage

8 with Darlington pair transistors. The amplifier stage has a

9 signal input to the cascaded amplifiers, two signal output

10 terminals from the Darlington pair transistors, a power input

11 terminal, and a return terminal. A PIN photodiode has one

12 terminal coupled to the signal input of the amplifier stage and a

13 second terminal coupled through a resistance to one of the two

14 signal output terminals so as to provide the received signal

15 strength indicating function between the two signal output

16 terminals.
